WHAT IS CLAIMED IS:

1.   1.   A method of voice organizer message delivery comprising:
2.   recording a voice organizer message from a first user;
3.   storing the voice organizer message to be delivered to a second user on a specified
4.   date;
5.   upon said specified date, delivering the voice organizer message to the second user;
6.   and
7.   periodically redelivering the voice organizer message at a frequency specified by the
8.   first user, wherein the frequency is selected from a group consisting of at least three
9.   frequencies.

1.   2.   The method of claim 1, wherein the second user and the first user are the same user.

1.   3.   The method of claim 1, wherein the at least three frequencies include daily, weekly
2.   and monthly.

1.   4.   The method of claim 1, further including responding to commands from the first user
2.   by modifying the voice organizer message.

1.   5.   The method of claim 1, further including responding to commands from the first user
2.   by changing the specified date of the voice organizer message.

1.   6.   The method of claim 1, further including responding to commands from the first user
2.   by changing the frequency of the voice organizer message.

1.   7.   A method of voice organizer message delivery comprising:
2.   recording a voice organizer message from a first user;
3.   associating a message-specific passcode with the voice organizer message;
4.   storing the voice organizer message to be delivered to a second user on a specified
5.   date;

6   upon said specified date, delivering the voice organizer message to the second user;

7   and

8   periodically redelivering the voice organizer message at a frequency specified by the

9   first user, wherein the frequency is selected from a group consisting of at least three

10   frequencies.

1   8.   The method of claim 7, wherein the delivering step includes:

2   notifying the second user of the voice organizer message;

3   upon a response from the second user, playing the voice organizer message.

1   9.   The method of claim 8, wherein the response from the second user includes entering

2   the message-specific passcode.

1   10.   The method of claim 7, further including responding to commands from the first user

2   by modifying the message-specific passcode associated with the voice organizer message.

1   11.   The method of claim 7, wherein the message-specific passcode is a passcode

2   corresponding to a voice mailbox associated with the second user.

1   12.   A method of voice organizer message delivery comprising:

2   recording a voice organizer message from a first user;

3   storing the voice organizer message to be delivered to a second user on a specified

4   date;

5   upon said specified date, automatically calling the second user to deliver the voice

6   organizer message to the second user; and

7   if delivery of the voice organizer message fails, placing the voice organizer message

8   in a voice mailbox associated with the second user.

1   13.   The method of claim 12, further including associating a message-specific passcode

2   with the voice organizer message.

1 14. The method of claim 13, wherein delivery of the voice organizer message fails when
2 the second user fails to enter the message-specific passcode.

1 15. A voice organizer system comprising:
2   a central processing unit;
3   a message intake module, executed by the central processing unit, for storing a voice
4 organizer message created by a first user;
5   a message delivery module, executed by the central processing unit, the message
6 delivery module including instructions for:
7   delivering the voice organizer message to a second user on a date specified by
8 the first user; and
9   periodically redelivering the voice organizer message at a frequency specified
10 by the first user, wherein the frequency is selected from a group consisting of at least three
11 frequencies.

1 16. The system of claim 15, wherein the second user and the first user are the same user.

1 17. The system of claim 15, wherein the three frequencies include daily, weekly and
2 monthly.

1 18. The system of claim 15, the message intake module further including modification
2 instructions for responding to commands from the first user to modify the voice organizer
3 message.

1 19. The system of claim 15, the message intake module further including modification
2 instructions for responding to commands from the first user to change the specified date of
3 the voice organizer message.

1 20. The system of claim 15, the message intake module further including modification
2 instructions for responding to commands from the first user to change the frequency of the
3 voice organizer message.

21.   The system of claim 15, the message intake module further including passcode instructions for associating a message-specific passcode with the voice organizer message.

22.   The system of claim 21, the message intake module further including modification instructions for responding to commands from the first user to modify the message-specific passcode associated with the voice organizer message.

23.   The system of claim 21, wherein the message delivery module includes instructions requiring entry of the message-specific passcode by the second user in order to deliver the voice organizer message to the second user.

24.   The system of claim 21, wherein the message-specific passcode is a passcode corresponding to a voice mailbox associated with the second user.

25.   A voice organizer system comprising:
        a central processing unit;
        a message intake module, executed by the central processing unit, for storing a voice organizer message created by a first user;
        a message delivery module, executed by the central processing unit, the message delivery module including instructions for:
                automatically calling the second user on a date specified by the first user to deliver the voice organizer message to the second user; and
                if delivery of the voice organizer message fails, placing the voice organizer message in a voice mailbox associated with the second user.

26.   The system of claim 25, the message intake module further including passcode instructions for associating a message-specific passcode with the voice organizer message.

27.   The system of claim 26, wherein the message delivery module includes instructions causing delivery of the voice organizer message to fail if the second user fails to enter the message-specific passcode.

28.   A computer program product for use in conjunction with a computer system, the computer program product comprising a computer readable storage medium and a computer program mechanism embedded therein, the computer program mechanism comprising:

a message intake module, executed by the central processing unit, for storing a voice organizer message created by a first user;

a message delivery module, executed by the computer system the message delivery module including instructions for:

delivering the voice organizer message to a second user on a date specified by the first user; and

periodically redelivering the voice organizer message at a frequency specified by the first user, wherein the frequency is selected from a group consisting of at least three frequencies.

29.   The computer program mechanism of claim 28, wherein the second user and the first user are the same user.

30.   The computer program mechanism of claim 28, wherein the three frequencies include daily, weekly and monthly.

31.   The computer program mechanism of claim 28, the message intake module further including modification instructions for responding to commands from the first user to modify the voice organizer message.

32.   The computer program mechanism of claim 28, the message intake module further including modification instructions for responding to commands from the first user to change the specified date of the voice organizer message.

33.   The computer program mechanism of claim 28, the message intake module further including modification instructions for responding to commands from the first user to change the frequency of the voice organizer message.

1   34.   The computer program mechanism of claim 28, further including passcode

2   instructions for associating a message-specific passcode with the voice organizer message.

1   35.   The computer program mechanism of claim 34, the message intake module further

2   including modification instructions for responding to commands from the first user to modify

3   the message-specific passcode associated with the voice organizer message.

1   36.   The computer program mechanism of claim 34, wherein the message delivery module

2   includes instructions requiring entry of the message-specific passcode in order to deliver the

3   voice organizer message to the second user.

1   37.   The computer program mechanism of claim 34, wherein the message-specific

2   passcode is a passcode corresponding to a voice mailbox associated with the second user.

1   38.   A computer program product for use in conjunction with a computer system, the

2   computer program product comprising a computer readable storage medium and a computer

3   program mechanism embedded therein, the computer program mechanism comprising:

4   a message intake module, executed by the central processing unit, for storing a voice

5   organizer message created by a first user;

6   a message delivery module, executed by the computer system, the message delivery

7   module including instructions for:

8   automatically calling the second user on a date specified by the first user to

9   deliver the voice organizer message to the second user; and

10   if delivery of the voice organizer message fails, placing the voice organizer

11   message in a voice mailbox associated with the second user.

1   39.   The computer program mechanism of claim 38, further including a passcode module,

2   executed by the computer system, for associating a message-specific passcode with the voice

3   organizer message.

1   40.   The computer program mechanism of claim 39, wherein the message delivery module

2   includes instructions causing delivery of the voice organizer message to fail if the second user

3   fails to enter the message-specific passcode.
